
Project Milestone 2

Introduction

Rewind's owner, Mr. Marty McFly approved your planned application for the loyalty program and requested that the loyalty program should be integrated into the cash register system.

Practical

Write a **C# console application** that will simulate Rewind's Loyalty Program. The application needs to make use of an initial customer entry form to obtain the customer details, followed by multiple Enum-driven menus to calculate the discounts, coupons and rewards the customer is eligible for. Finally, the customer should be able to order from a list of VHS tapes, DVDs, and CDs. At checkout, the discounts, coupons, and rewards should be applied, and the total amount displayed to the user.

Please follow the instructions below:

- The application should be a C# console application.
- The application should make use of Enum menus.
- Make use of methods to generate new menus and enforce reusable code.
- The application should allow you to order various media.
- It should keep track of what you have ordered as well as how much it costs.
- A person should be able to check out their order and if they do it should display the items ordered as well, the total price due as well as any additional coupons or rewards.
- The application should loop and after checkout, it should reset your cart. It should also give you the option to close the application.

Important notes:

- Refer to your pseudocode, flowcharts, and research materials throughout the implementation process.
- This project should be completed in groups of 3 students
- Every individual should submit the project.
- Make use of comments in your C# code to list the names of group members and to keep track and explain the functionality of code blocks, this will be useful to both your team as well as lecturers to understand and follow the logic used.

Project defense:

- On 6 and 7 August 2024 you will be randomly assigned a timeslot to explain your project.
- You will have 5 minutes to walk the lecturer through your project.
- The lecturer will question you for 25 minutes to test your understanding of your own code.
- Each member of the group will be questioned and is required to be present.

Additional Information

- All work must be done on your own.
- Belgium Campus uses software that can **scan for plagiarism** and a student caught doing this will get 0 marks for this assignment.
- This project must be done in groups of 3 students. Group members must be from the same class.
- Each group member must upload the document and clearly indicate who was responsible for which part of this milestone.
- Submit your entire project folder as a ZIP file.
